ARITHMETIC OPERATIONS USING RPC

AIM:

To Develop a simple calculator using XMLRPC

ALGORITHM:

Server.py

1. Import XMLRPCServer package
2. Define functions for addition, subtraction, multiplication, division and modulus
3. Initialize simple XMLRPCServer with IP address (or localhost) and port number
4. Register the functions add, sub, mul, div and mod with the server
5. Handle the request
6. Close the connection

Client.py

1. Import XMLRPC Client package
2. Define functions for addition, subtraction, multiplication, division and modulus
3. Initialize simple XMLRPC Client with Server IP address (or localhost) and port number
4. Get two numbers a and b for arithmetic operations
5. Call add() function and print the result
6. Call sub() function and print the result
7. Call mul() function and print the result
8. Call div() function and print the result
9. Call mod() function and print the result
10. Close the connection

CODE:

Server.py

XML RPC PROGRAM- SERVER SIDE:

```
from xmlrpc.server import SimpleXMLRPCServer
# Define a function
def is_even(n):
    return n % 2 == 0
def add(a,b): return
a+b def sub(a,b):
return ab def
factorial(n):
```

```
factorial=1
for i in range(1,n+1):
    factorial = factorial*i
return factorial

def multiply(x, y):
    return x * y

def divide(x, y):
    return x // y

# Create server
server = SimpleXMLRPCServer(("localhost", 8000))
print("Listening on port 8000...")
# Register a function under a different name
server.register_function(is_even, "is_even")
server.register_function(add, "add")
server.register_function(sub, "sub")
server.register_function(factorial, "factorial")

#server.register_function(factorial, "factorial")
server.register_function(multiply, 'multiply')
server.register_function(divide, 'divide')
# Run the server's main loop
server.serve_forever()
```

Output:

```
1 from xmlrpc.server import SimpleXMLRPCServer
2 # Define a function
3 def is_even(n):
4     return n % 2 == 0
5 def add(a,b):
6     return a+b
7 def sub(a,b):
8     return a-b
9 def factorial(n):
10     factorial=1
11     for i in range(1,n+1):
12         factorial = factorial*i
13     return factorial
14 def multiply(x, y):
15     return x * y
16 def divide(x, y):
17     return x // y
18 # Create server
19 server = SimpleXMLRPCServer(("localhost", 8000))
20 print("Listening on port 8000...")
21 # Register a function under a different name
22 server.register_function(is_even, "is_even")
23 server.register_function(add, "add")
24 server.register_function(sub, "sub")
25 server.register_function(factorial, "factorial")
26
27 #server.register_function(factorial, "factorial")
28 server.register_function(multiply, 'multiply')
29 server.register_function(divide, 'divide')
30 # Run the server's main loop
31 server.serve_forever()
```

Listening on port 8000...

Client.py

XML RPC PROGRAM- CLIENT SIDE:

```

import xmlrpc.client proxy=
xmlrpc.client.ServerProxy('http://localhost:8000/') # local server for i in
range(5): a=int(input("Enter a number:")) b=int(input("Enter
b number:"))
print("%d is even?: %d" % (a, (proxy.is_even(a)))) #access XML-RPC server through proxy
print("addition of given number is %d "%((proxy.add(a,b)))) print("sub of given number is
%d "%((proxy.sub(a,b)))) print("factorial: %d"
%((proxy.factorial(a)))) print("factorial: %d"
%((proxy.factorial(b)))) print("Multiplication of 2 numbers is
%d" %(proxy.multiply(a,b)) print("Division of 2 numbers is %d"
%(proxy.divide(a,b))

```

Output:

```

BOOTSTRAP > client.py > ...
1  import xmlrpc.client
2
3  proxy = xmlrpc.client.ServerProxy('http://localhost:8000/') # local server
4
5  for i in range(5):
6      a = int(input("Enter a number: "))
7      b = int(input("Enter b number: "))
8
9      print("%d is even?: %d" % (a, proxy.is_even(a))) # access XML-RPC server through proxy
10     print("Addition of given numbers is %d" % (proxy.add(a, b)))
11     print("Subtraction of given numbers is %d" % (proxy.sub(a, b)))
12     print("Factorial of %d is %d" % (a, proxy.factorial(a)))
13     print("Factorial of %d is %d" % (b, proxy.factorial(b)))
14     print("Multiplication of 2 numbers is %d" % (proxy.multiply(a, b)))
15     print("Division of 2 numbers is %d" % (proxy.divide(a, b)))
